## CLAIMS

1. An organic electrolyte battery separator, which is composed of a nonwoven comprising a heat-and-humidity gelling resin capable of gelling by heating in the presence of moisture and another fiber,

the other fiber being fixed with a gel material obtained by causing the heat and humidity gelling resin to gel under heat and humidity, and

the nonwoven having a mean flow pore diameter of 0.3 µm to 5 µm and a bubble point pore diameter of 3 µm to 20 µm as measured in accordance with ASTM F 316 86.

- 2. The organic electrolyte battery separator according to claim 1, wherein the heat-and-humidity gelling resin is a heat-and-humidity gelling fiber, the heat-and-humidity gelling resin being provided at least at a portion of a surface of the heat-and-humidity gelling fiber.
- 3. The organic electrolyte battery separator according to claim 1, wherein a proportion of the nonwoven occupied by the heat-and-humidity gelling resin is in a range of 10 mass% to 50 mass%.
- 4. The organic electrolyte battery separator according to claim 1, wherein the heat-and-humidity gelling resin is an ethylene-vinyl alcohol copolymer.
- 5. The organic electrolyte battery separator according to claim 1, wherein the other fiber has a fiber diameter of 15 µm or less.
- 6. The organic electrolyte battery separator according to claim 1, wherein an average fiber diameter of the other fiber constituting the nonwoven is 10 µm or less.
  - 7. The organic electrolyte battery separator according to claim 1, wherein the fiber constituting the nonwoven other than the heat-and-humidity gelling resin is an olefin fiber.
  - 8. The organic electrolyte battery separator according to claim 1,

wherein the other fiber includes a high-strength fiber having a single fiber strength of 4.5 cN/dtex or more in a range of 5 to 250 parts by mass where the heat-and-humidity gelling resin is assumed to be 100 parts by mass.

- 9. The organic electrolyte battery separator according to claim 1, wherein the other fiber includes a heat-melting fiber that does not substantially shrink at a temperature that causes the heat-and-humidity gelling resin to gel under heat and humidity to fix the other fiber, in a range of 10 to 300 parts by mass where the heat-and-humidity gelling resin is assumed to be 100 parts by mass.
- 10. The organic electrolyte battery separator according to claim 1, wherein the nonwoven further comprises a synthetic pulp in addition to the other fiber.
- 11. The organic electrolyte battery separator according to claim 1, wherein the synthetic pulp is included in a range of 10 to 200 parts by mass where the heat-and-humidity gelling resin is assumed to be 100 parts by mass.
- 12. The organic electrolyte battery separator according to claim 2, wherein an average fiber diameter of the heat-and-humidity gelling fiber and the other fiber is 10 µm or less.
- 25
- 13. The organic electrolyte battery separator according to claim 2, wherein the heat-and-humidity gelling fiber has a fiber diameter of 1 to 6 µm.
- 30 14. The organic electrolyte battery separator according to claim 13, wherein the heat-and-humidity gelling fiber is a fiber provided by splitting a splittable composite fiber that contains the heat-and-humidity gelling resin and another resin, which are adjacent to each other in a cross-section of the fiber.
- 35
- 15. The organic electrolyte battery separator according to claim 14, wherein, when the splittable composite fiber comprised of the

heat-and-humidity gelling resin and another resin, which are adjacent to each other in a cross-section of the fiber, to be able to provide the heat-and-humidity gelling fiber, is assumed to be 100 parts by mass,

the nonwoven comprises, as the other fiber, a high-strength fiber having a single fiber strength of 4.5 cN/dtex or more in a range of 10 to 200 parts by mass, and

the nonwoven further comprises a heat-melting fiber that does not substantially shrink at a temperature that causes the heat-and-humidity gelling resin to gel under heat and humidity to fix the other fiber, in a range of 10 to 200 parts by mass.

16. The organic electrolyte battery separator according to claim 14, wherein, when the splittable composite fiber comprised of the heat-and-humidity gelling resin and another resin, which are adjacent to each other in a cross-section of the fiber, to be able to provide the heat-and-humidity gelling fiber, is assumed to be 100 parts by mass,

the nonwoven comprises, as the other fiber, a high-strength fiber having a single fiber strength of 4.5 cN/dtex or more in a range of 6.25 to 120 parts by mass,

the nonwoven further comprises a heat-melting fiber that does not substantially shrink at a temperature that causes the heat-and-humidity gelling resin to gel under heat and humidity to fix the other fiber, in a range of 12.5 to 120 parts by mass, and

the nonwoven further comprises the synthetic pulp in a range of 6.25 to 120 parts by mass.

- 17. The organic electrolyte battery separator according to claim 2, wherein the fiber constituting the nonwoven is a short fiber having a fiber length in a range of 1 mm to 20 mm, and the nonwoven is a wetlaid nonwoven obtained by a wetlaying process using the short fiber.
- 18. The organic electrolyte battery separator according to claim 17, wherein the splittable composite fiber is split during the wetlaying step to provide a heat-and-humidity gelling fiber, and the heat-and-humidity gelling fiber is substantially uniformly present in the nonwoven.
- 19. The organic electrolyte battery separator according to claim 1,

wherein a surface of the nonwoven is partially covered with a film-like gel material.

- 20. The organic electrolyte battery separator according to claim 19, wherein an area proportion of the film-like gel material with respect to an entire surface of the nonwoven is in a range of 40% to 90%.
  - 21. The organic electrolyte battery separator according to claim 1, wherein a contact angle of dechlorinated water dropped on a surface of the nonwoven is 60 degrees or less 5 seconds after dropping of the dechlorinated water.

10

15

20

35

- 22. The organic electrolyte battery separator according to claim 1, wherein the nonwoven has a puncture strength of 2 N or more and a standard deviation of 1.1 N or less.
- 23. The organic electrolyte battery separator according to claim 22, wherein a variation index of the puncture strength of the nonwoven is 0.165 or less, the variation being calculated from the puncture strength and the standard deviation using the following expression:

variation index of puncture strength = standard deviation/puncture strength.

- 24. The organic electrolyte battery separator according to claim 1, wherein the separator has a thickness in a range of 15 μm to 80 μm and the nonwoven has a specific volume in a range of 1.2 cm³/g to 2.5 cm³/g.
- 25. A method for producing an organic electrolyte battery separator composed of a nonwoven comprising a heat-and-humidity gelling fiber in which a resin capable of gelling by heating in the presence of moisture is present on at least a portion of a surface of the fiber, and another fiber, the method comprising at least steps of:
  - A. preparing a nonwoven sheet comprising the heat-and-humidity gelling fiber and the other fiber;
    - B. subjecting the nonwoven sheet to a hydrophilic treatment;
    - C. providing moisture to the hydrophilic-treated nonwoven sheet

to obtain a water-containing sheet; and

30

35

- D. subjecting the water-containing sheet to gel processing by a heat-and-humidity treatment using a heat treatment device that is set to a certain temperature within a range of no less than a temperature at which the heat-and-humidity gelling resin gels and no more than "the melting point of the heat-and-humidity gelling resin 20°C", to cause the heat-and-humidity gelling resin to gel, and fixing the other fiber using the heat-and-humidity gelling resin gel.
- 10 26. The organic electrolyte battery separator producing method according to claim 25, wherein the average fiber diameter of the nonwoven sheet is 10 µm or less.
- 27. The organic electrolyte battery separator producing method according to claim 25, wherein a proportion of the moisture provided to the hydrophilic treated nonwoven sheet is in a range of 20 mass% to 300 mass%.
- 28. The organic electrolyte battery separator producing method according to claim 25, wherein a contact angle of dechlorinated water dropped on a surface of the hydrophilic-treated nonwoven sheet is 60 degrees or less 5 seconds after dropping of the dechlorinated water
- 29. The organic electrolyte battery separator producing method according to claim 25, wherein the hydrophilic treatment is an exposure to fluorine gas atmosphere.
  - 30. The organic electrolyte battery separator producing method according to claim 25, wherein the gel processing is press processing.
  - 31. The organic electrolyte battery separator producing method according to claim 25, wherein the gel processing is press processing using a thermal roller, and a line pressure of the thermal roller is in a range of 350 N/cm to 10000 N/cm.
  - 32. An organic electrolyte battery comprising the separator according to claim 1.
